

STREAMING VIDEOS OVER CONNECTIONS WITH NARROW BANDWIDTH

ABSTRACT OF THE DISCLOSURE

A method for frame streaming using intelligent frame selection comprises ranking a plurality of frames according to a plurality of priorities. The method further comprises selecting, during a run-time, a frame for transmission over a network to a receiving client, wherein selecting the frame comprises determining a time of transmission, wherein the time of transmission is the time the frame will take to reach the receiving client. Selecting further comprises determining the frame's rank, determining a bandwidth over the network, and determining a current time.
